Minjerribah, Queensland, Australia
28 September 2026

Begin here

I began with a personal intention to get healthy again. It connected with a larger body of work: Aura clothing and consumables, virtues worn close to the body, drinks and elixirs, original music, useful technology and Joyful Responsible Abundance. The product engine brings those interests into a practical process for creating products, reaching customers and building communities that keep value circulating.

This document sets out the engine's design and operating method. It explains how people move between an idea, a product, a market, a sale and the next cycle of use. Product specifications, commercial agreements and working software take shape through the activities described here.

The engine has no preset hierarchy or authority. People enter through a need, a skill, a product, a community, a material or an opportunity. They find one another, exchange information and agree the work they undertake together. No project sits above the others. A brand, a founder, an investor, an agent or the person hosting the software gains no general authority over the network through that position.

Product creation, marketing, sales, community building and circular economies connect throughout the process. A customer conversation changes a design. A repair reveals a better construction method. A gathering introduces a maker to a retailer. Returned packaging enters another production cycle. Income pays people and resources further activity through agreements made by those involved.

Aura Undies, drinks and elixirs, P4A, GAJRA Earth and community club merchandise, hygiene products and the open-ended "Aura of" expressions give the engine concrete starting material. These products make its work tangible. They also reveal different requirements: fit and fabric, flavour and storage, artwork and reproduction, ordering and delivery. The engine carries those differences while connecting the people and resources around them.

This is a market economy engine. Customers buy products, makers receive payment and enterprises manage costs, income and ownership. Community participation creates relationships that extend beyond a transaction. Circular economies connect those relationships with the continued use of materials, products, knowledge and productive capability.

Joyful Responsible Abundance is the purpose running through this work. People create things they enjoy, take responsibility for the exchanges they enter and expand access to useful products and the means of making them. Minjerribah, Australia and Oceania provide places and relationships from which these connections grow.

1 An engine with no preset hierarchy

The engine connects people, products, materials, designs, services and projects through the relationships between them. A drink connects to its recipe, ingredients, maker, packaging and places of sale. The same maker connects to other products. An artwork connects to a garment, a music release and the people who created it. Each connection explains what passes between the participants and the terms they agree.

There is no fixed top level and no compulsory entry point. Someone starts with surplus fabric, another with a favourite flavour, another with an audience looking for useful products. A customer enters through a purchase or an idea. A maker enters through an offer of capacity. Their paths meet wherever the exchange makes sense to them.

People choose their responsibilities for a particular piece of work. One person arranges a production run, another creates the artwork and another hosts a tasting. Those responsibilities describe an agreed contribution and its limits. They expire, change or transfer through the relevant participants' agreement. Completing one task creates experience and relationships, without creating permanent rank.

Commitments sit with the people making them. The engine records who contributes an asset, commits funds, supplies a service or accepts an order. Participants agree how they make joint decisions and resolve disagreements for that activity. Where they establish a business or cooperative, its arrangements belong to that enterprise and do not become rules for everyone using the engine.

The sequence follows the work. A garment starts from a design and reaches a maker. A maker with unused capacity starts from available equipment and finds a suitable design. An existing community starts from a shared need and develops an offer. The process provides routes through these activities, with room to revisit any part as information changes.

AI assists with finding connections, drafting material and organising records. A recommendation has no authority of its own. People select the tools they use and explicitly authorise actions taken on their behalf. Records remain exportable so that the work and its relationships remain useful beyond a particular platform.

2 Product creation from an idea to a usable offer

Product creation begins by making an intention understandable. Describe the experience, the person using the product and the occasion in which it matters. Bring a sketch, recipe, sample, existing object or conversation into the record. The first useful output is a short product brief that others understand well enough to respond with questions, designs or an offer to help.

Explore the product through making. Prepare a sample, try it in its intended setting and record what happens. For a garment, this includes fit, movement, seams and washing. For a drink, it includes flavour, preparation, serving format and storage. People using the sample describe their experience in their own words. The next version responds to those observations.

Connect the design with the means of producing it. Identify materials, quantities, processes, equipment and available makers. Request quotations against the same specification so that differences in price and service remain understandable. Record the actual quotation alongside delivery timing, minimum quantities and the work included. Keep estimates dated and tied to their assumptions.

Build the offer while developing the product. Describe what the customer receives, how they use it, what it costs and how it reaches them. Compare a single item, a refill, a multipack or a collection in terms of convenience and total cost. Give each offer its own ordering and fulfilment details, even when several offers use the same underlying product.

Prepare the production information from the agreed version. The recipe or pattern, artwork files, material specifications and sample feedback travel together. Identify the checks relevant to that product and who performs them, including specialist formulation or manufacturing work where required. Changes stay connected to the versions and orders they affect.

Production returns information to design. Yield, waste, damaged items, packing effort and delivery experience reveal the practical cost of making the product. Customer use adds another source of learning. The cycle continues through revised specifications, replenishment, repair, replacement parts and new products that reuse the knowledge already gained.

3 Aura products and personally chosen meaning

"Aura of" gives people a vocabulary for products they choose, use and share. Aura of Love, Aura of Health, Aura of Joy, Aura of Peace, Aura of Intimacy and Aura of Virtue connect personal meaning with tangible things. The vocabulary remains open to other expressions, languages and interpretations.

These expressions act as connections across the range. A product belongs with several themes, occasions or creative works when those relationships are useful. People browse by what they need, a value they connect with, the maker, the material or the setting in which they use it. The catalogue accommodates those different routes without imposing a single family tree.

Aura of Love brings affection and connection into creative briefs for gifts, garments, drinks, music and shared experiences. Aura of Health carries the aspiration to enjoy healthier everyday routines. Each product description explains the actual ingredients, materials and use of the item. The name supplies a creative direction, while the product information explains what the customer is buying.

Aura of Joy connects with play, colour, lively flavours and celebration. Aura of Peace connects with quiet moments, gentle designs, tea, journals and music. Aura of Courage, Curiosity, Beauty and Inspiration open further directions. People selecting an expression give it meaning in their own lives, without the business assigning beliefs or personality traits to them.

Merchandise gives these ideas useful physical forms: clothing, hats, bags, mugs, reusable bottles, journals, prints, eye masks and gifts. Design starts with the object and its use. A design for a shirt needs different placement and production files from a mug or a journal. Materials, comfort, finish and durability remain part of the creative brief.

Collections connect items around an experience. A gathering brings together a drink, serving ware and music. A personal ritual brings together a journal, an infusion and a chosen virtue. Each item has a standalone offer, while a collection explains the value of bringing the items together. Customer response then informs the next design, format or combination.

4 Aura Undies and virtues worn close to the body

Aura Undies is a major expression of the engine. I dislike wearing other people's names on my clothing, especially underwear. I prefer wearing a value I choose for myself. That gives the range its starting point: comfortable underwear carrying words such as love, courage, kindness, joy or peace where they feel personally meaningful.

The original presentation names Intimate Values, Virtuous Undies, Aura of Intimacy and Aura of Virtue. These expressions connect the garment with a private relationship to oneself. The wearer chooses the virtue. The design gives that word prominence and keeps the maker's identity discreet.

The subliminal intention is a quiet, repeated encounter with a personally chosen quality in everyday life. Encouraging self-love and confidence is the creative aspiration. Each person decides what the word means to them and how it belongs in their life. The product description presents that intention without promising a psychological outcome.

Creation starts with garment use: the cut, support, movement, fabric feel and experience of wearing it throughout the day. The source range spans women's bodysuits, women's and men's underwear, tops and related sportswear. Samples turn that range into specific decisions about seams, waistbands, sizing, colour and wording placement. Wear and wash feedback becomes part of the next pattern or production instruction.

The engine links each garment version with its chosen virtue, language, fabric, size and placement. Fluent speakers review wording in their language. Makers receive the construction details and lettering files together. Customer conversations reveal preferred combinations. Sales records inform replenishment for each actual combination, without turning a purchase into a judgement about the buyer.

Marketing begins with the reason for wearing a chosen virtue and shows the real garment, fit and finish. Everyday pairs, multipacks and more luxurious fabrics create distinct offers with clear prices. Customers share experiences and suggest designs through voluntary participation. Practical feedback stays connected to the relevant garment.

Circular design begins with durability and accurate sizing. The record follows material composition, packaging and available recovery routes. Worn intimate garments need an appropriate textile pathway. The engine records the receiving service's actual acceptance conditions, keeping usable material in circulation wherever a working route exists.

5 Drinks elixirs and shared experiences

Drinks and elixirs give the engine a repeatable product experience built around flavour, ingredients and the enjoyment of a daily ritual. The design space includes ready-to-drink beverages, concentrates, botanical infusions, tea blends and drinks prepared at a cafe, market or gathering. The product brief identifies the occasion and the experience of preparing, serving and drinking it.

Formulation connects the recipe with capable makers and ingredient suppliers. Record each version's quantities, preparation process, serving size, packaging and storage requirements. Compare samples in the setting where people drink them. Tasting feedback describes flavour, sweetness, aroma, texture and convenience, giving recipe development something specific to work with.

The commercial offer follows the setting. A single serving suits immediate use. A concentrate gives a household several servings. A hospitality pack supports repeated service. Each format carries its own cost per serve, preparation instructions, packaging and delivery requirements. Product information reflects the actual formulation and agreed manufacturing specification.

Marketing grows from that experience. A tasting introduces the drink and gathers responses. Preparation demonstrations show how it fits into daily life. Ingredient and maker stories add context where those details matter to customers. A music release, original illustration or Aura expression connects the product with a broader collection through an agreed creative collaboration.

Community connections extend into growing, cooking and gathering. Garden Mate, Kitchen Mate, Fermentation Mate and Event Mate provide reference points for those activities. The practical connection names the contribution: a recipe, growing information, a workshop or a gathering plan. Participants choose the tools and people relevant to the product they are creating.

Circular production follows the ingredients and packaging beyond the sale. Record batch quantities, losses, unused ingredients and packaging returns. A refill arrangement includes a receiving point, suitable containers, cleaning arrangements and the cost of operating the service. Ingredients and by-products enter another use only through a suitable receiving process. Feedback from those routes changes the next batch, package or delivery arrangement.

6 P4A and GAJRA Earth merchandise

P4A and GAJRA Earth merchandise bring distinct creative identities into the same product engine. Each collection connects its imagery, language and purpose with objects people enjoy owning and using. Participants choose the collection and contributions that interest them. The engine carries the commercial work without placing one project above another.

The p4a.xyz gear pages provide a concrete reference for purple clothing, beginning with hoodies and extending into shirts, stickers, homewares and event material. Their ordering design connects garment choice, size, quantity, printing, local collection or postage and a support amount chosen by the buyer. The published test checkout remains a design reference and takes no payment.

Product creation translates a P4A design into an actual garment and print specification. Compare samples for fit, fabric, colour and finish. Keep the selected artwork connected to the production file and quotation. The commercial record separates the item cost, delivery and any chosen support amount. That pricing arrangement belongs to the particular offer, with its destination explained to the buyer.

GAJRA Earth merchandise starts with a collection brief expressing Joyful Responsible Abundance and the project's wider creative direction. The brief selects from clothing, reusable bottles, mugs, bags, journals, prints and other useful formats. Designers develop artwork for the chosen object, agree its use and prepare production files. Product pages identify the maker, materials, price and fulfilment arrangement.

Marketing connects the object with its story through photographs, music, short films, demonstrations and gatherings. A P4A item links to the relevant p4a.xyz material. A GAJRA Earth item links to its own project story. Customers choose whether to explore further. Any contribution from a sale to associated work is stated for that offer, including how the amount is calculated.

Sales and community feedback return to the collection's records. Bulk orders connect quantities and sizes with the people receiving them. Repairs, garment care, reusable packaging and suitable material recovery extend the life of the products. Shared makers and production methods connect these collections with Aura products while each retains its own identity and agreements.

7 Hygiene products and the purple piss mat

Hygiene products bring everyday cleaning, personal care and bathroom use into the engine. The range begins with a practical need and the experience of the person using the item. A product brief defines the setting, contact with the body or surfaces, cleaning method, materials, packaging and cost of continued use. Soap, wash products, cleaning cloths and bathroom accessories provide formats for developing that brief.

The purple piss mat is a named product in this range and connects with P4A's toilet humour and purple identity. It brings a recognisable joke into an ordinary bathroom object. Its product brief defines the exact placement and purpose, the shape and dimensions, absorbency, backing, stability on the intended floor and the way it is cleaned or replaced.

Make samples and use them in the intended setting. Record liquid handling, drying time, odour after use, colourfastness and the condition of the backing through repeated cleaning. Compare how easily someone lifts, cleans, dries and returns the mat to use. Those observations determine the construction and care instructions that accompany the product.

The engine holds the mat's material composition, supplier, pattern, colour, artwork, production cost and care information together. Any scent or treatment becomes an explicit formulation choice with its own specification and suitability checks. Product descriptions report the actual construction and supported performance. The name and humour give the mat character while its practical qualities give people a reason to keep using it.

Marketing shows the real product in its setting and explains its use and care clearly. P4A's origin story supplies a connection for people interested in the humour. Sales offers state dimensions, materials, price and delivery. Customer feedback about cleaning, wear or fit returns directly to the product record and the next production decision.

Circular use follows the chosen construction. For a washable mat, record repeated use, replacement parts and the receiving conditions of any material recovery service. Cleaning products connect refills with suitable containers and handling arrangements. Each route includes collection, cleaning or processing costs. Track what actually returns to use and carry that experience into the next design.

8 Community club merchandise as a reusable pattern

Community club merchandise is a repeatable, customisable pattern in the engine. Sandy Sports and Screen Club supplies the worked example, connected with Community Club Builder and the sand sports and screen activity explored in the related projects. The pattern gives each club a starting method for its own products, identity and commercial arrangements.

Begin with a club collection brief. Enter the club name, artwork, colours, wording, activities, product choices and the people contributing to the release. Set the ordering window, production quantities, prices, collection or delivery arrangements and any contribution to club activity. These choices belong to the participating club. The template leaves them open for each new use. Clubs also choose whether to join a mutual for shared purchasing or production, using agreed membership terms.

For Sandy Sports and Screen Club, the design brief connects sports participation and screen gatherings with shirts, hoodies, hats, reusable bottles, bags and event prints. Each selected item has a practical use and an artwork specification. Members and collaborators contribute ideas and sample feedback. The source projects supply the activity context, while the merchandise brief establishes the actual collection and production arrangements. Minjerribah Screen & Media Network connects club stories with the media production process.

Community Club Builder provides the wider club-building context, invitations and reusable planning material. The product engine adds a connected merchandise pack: artwork files, product and size options, supplier quotations, costing, order information, promotional material and a fulfilment list. These outputs draw from the same collection record so a change in size, design or delivery timing reaches the relevant documents.

An order window gathers demand before a batch is commissioned. Participants see the total price, expected timing and any minimum quantity. The club explains how it handles a batch that misses the minimum. Fulfilment connects each order to its item and chosen handover method. Financial records separate product costs from the amount allocated to club activities.

Repeat the pattern for another club or event by retaining the workflow and entering that group's choices. Reuse artwork only under its agreed terms. Keep personal order information with the relevant group. A template transfers a useful process without transferring authority, membership or assumptions about how the next club organises itself.

After each release, record fit, quality, demand and fulfilment effort. Reorders reuse the agreed specification. Repair, suitable second-hand exchange and equipment or garment sharing extend useful life. Feedback from those activities improves the next collection and the reusable pattern itself.

9 Project connections through shared work

Project interconnectivity starts with an exchange. P4A and GAJRA Earth connect to merchandise through artwork. A garden connects to a drink through an ingredient supplier. A learning activity connects to production through paid practice. Record the contribution, its source, the people involved and the terms of use. The relationship becomes useful through the work it supports.

The following map identifies connection points in the supplied projects. These are starting references for collaboration. Participation and responsibilities arise through the specific exchange.

Project or project family	Connection point	Use in the engine
Aura of Intelligence	Personal meaning, preferences and creative identity	Product discovery, expressions and customisation
Oceania Healthy De-Slop Co-ops	Everyday wellbeing and local relationships	Shared needs, gatherings and product conversations
Garden Mate Kitchen Mate Fermentation Mate Event Mate	Growing, preparation, preservation and gathering	Recipes, companions, workshops and product use
Strange but True	Creative work, markets and practical services	Demonstration, sales and customer relationships
i C. infinity and Infinity Engine	Songs, album worlds and visual production	Artwork, merchandise, music and release assets
AI-Native Indie Distribution	Release packs, metadata and handoff documents	Marketing preparation and distribution workflows
Ready S.E.T. Co-op Mutual Futures and 500 Queens	Learning, enterprise and productive participation	Skills, paid work and optional mutual ownership
Civic AI and local computing projects	Computing, design and shared capability	Tools and services selected for particular work
Project Atlas GAJRA Earth and P4A	Project discovery and creative identities	Merchandise collections and collaborators

A project retains its own purpose and connects to several activities at once. Participants agree a commission, supply arrangement, licence or shared activity at the point of use. The engine records the relationship without granting the contributing project authority over the others.

Community Club Builder connects club activity with repeatable merchandise packs, using Sandy Sports and Screen Club as an example. Each exchange leaves reusable files, experience and relationships. Project Atlas supports discovery, while product records hold the detail needed to act.

10 Marketing through meaning and experience

Marketing begins during creation. Listen to the language people use when describing a need, an experience they enjoy or something that frustrates them. Bring that language into the product brief and explain the offer clearly. Show what the product is, why someone chooses it and what using it involves.

The marketing record connects an audience and occasion with a specific offer, message, channel and response. For Aura Undies, the message starts with wearing a personally chosen virtue and the experience of the garment. For an elixir, it starts with taste, preparation and the moment of use. Each message stays close to the actual product.

Make a connected set of release materials from that record. Product photographs show the item and important details. Demonstrations show use. Descriptions explain sizes, ingredients or materials, price and delivery. Short videos, retailer sheets, packaging copy and event material draw from the same product information, with their presentation adapted to each setting.

The i C. infinity Music Universe connects songs, lyrics and visual worlds with product storytelling. The Infinity Engine provides a creative production reference for moving from a song and visual direction into stills, storyboards and screen formats. AI-Native Indie Distribution supplies a model for release packs, asset lists, metadata and handoffs. Creators agree the use of each contribution and the payment or other exchange attached to it. Minjerribah Screen & Media Network and DaVinci Resolve Automations connect local stories with the video workflow described in Chapter 17.

Choose channels through the people and setting involved: direct conversation, a market, a tasting, a retailer, a mailing list, a music audience or a product page. Record the effort and spending attached to each activity. Connect enquiries and orders back to the activity where that information is available, and ask customers how they found the product without making participation burdensome.

Marketing returns learning to creation. Questions reveal unclear descriptions. Repeated requests reveal useful variants. Demonstrations expose awkward preparation or packaging. Review those signals alongside sales and fulfilment costs, then revise the offer and its presentation. Customers control their participation in messages and community activity throughout the relationship.

11 Sales ordering and continuing service

A sale connects a clear offer with a customer's choice and the ability to fulfil it. The sales record holds the item, variant, quantity, price, delivery arrangement and the terms presented at purchase. Availability distinguishes stock ready to send from production against an order. The customer receives a clear account of what happens next.

Direct sales, markets, hospitality and wholesale each have their own commercial requirements. A market sale combines conversation, payment and immediate handover. An online order adds packing and delivery. A retailer orders quantities at an agreed price and needs dependable replenishment. The engine connects each route to the same product while keeping its costs and service arrangements visible.

Ordering links the product record with stock, production and the person or enterprise accepting the sale. Payment information connects to the relevant accounting process. Production receives the exact version and quantity ordered. Packing and dispatch record what left, where it went and how to follow up. Participants choose the services they use for these activities.

Collections combine products with different fulfilment needs. A music download, a pair of Aura Undies and a drink each retain their delivery details inside the combined offer. Customers see those details before purchasing. The release pack carries the correct files and descriptions for each destination, while physical stock stays connected to its storage and dispatch arrangements.

Service continues after delivery. Enquiries, exchanges, defects and returns connect to the relevant order and product version. The person handling the issue has the information needed to resolve it. Repeated problems feed directly into sizing, packaging, manufacturing instructions or the description of the offer.

Replenishment follows actual demand and capacity. Compare orders, repeat purchases, available stock, production lead times and cash committed. Account for returns and cancellations when reading the sales figures. A repeat purchase is one form of continuing value. Repairs, refills, replacement parts and useful product support create further commercial relationships around continued use.

12 Community building through participation

Community building begins with an activity people value together. A tasting, a design conversation, a sewing session, a listening event or a shared meal gives people a reason to meet. Products connect with those activities through use and experience. Participation remains open to people who bring curiosity, skills, stories or a practical contribution.

People choose how they participate. Someone buys an item, another offers feedback, another helps develop a new design. Others organise gatherings, teach a skill, introduce a maker or start an enterprise. These contributions connect through the work without becoming ranks in the community. Spending more or contributing more time grants no preset authority over others.

Each activity starts with a clear invitation: what is happening, where and when, any cost, what participants bring and how to stay involved. People organising the activity agree its arrangements together. They make any paid work, voluntary contribution or commercial collaboration clear at the point of participation.

The engine keeps ideas connected to the conversations that generated them. A request for a different garment fit reaches the design record. Interest in a refill service reaches the people arranging distribution. A community recipe connects to its contributors and agreed use. Participation has a visible path into practical activity, and contributors receive a response about what happens next.

Shared spaces include conversations, gatherings, workshops and optional online channels. People choose what they share and which communications they receive. Personal stories and feedback enter public marketing through the contributor's agreement. Community life has room for enjoyment and mutual support alongside commercial activity.

Learning travels through making and doing. Experienced participants demonstrate a process, newcomers try it and paid opportunities connect with the skills developed. Ready S.E.T. Co-op, Mutual Futures and 500 Queens offer reference points for exploring learning, enterprise participation and ownership. The arrangements grow from the people involved in each activity.

C-hours have a supporting place where participants choose to recognise voluntary community activity. Commercial sales, paid work and investment retain their own arrangements. The central connection is between useful products, valued experiences and communities that sustain relationships over time.

13 Circular economies through continued use

Circular economies connect the next use to the current product. Design, materials, production, sale, use and recovery remain connected in the record. The engine follows what actually returns, who receives it and how it enters another use. Every circular route includes the practical work and cost of keeping it running.

Begin with the product's useful life. Select materials and construction with durability, maintenance and the intended use in mind. Record care instructions, replaceable parts and repair methods alongside the specification. A durable garment, a refillable container and reusable production equipment each keep value in use through different arrangements.

For drinks, connect packaging returns with collection points, transport, inspection, cleaning and the next fill. Agree who performs each activity and how it is funded. Include rejected containers and breakage in the operating record. A deposit or refill price belongs to a specific offer and receiving arrangement, with its conditions clear to the customer.

For clothing and merchandise, connect repairs, reusable components, suitable resale and textile recovery to the product's condition and material. Underwear has different receiving requirements from an outer garment or a bag. Record the actual service accepting the item and what happens to it. Material composition and construction choices inform the next design when recovery proves difficult.

Production creates its own circulation opportunities. Offcuts, unused packaging, surplus stock and equipment capacity become discoverable offers. Another participant identifies a use, confirms suitability and agrees the exchange. Quantities, condition, transport and processing effort determine whether that connection works. The engine records the completed movement and its cost.

Commercial circulation connects paid work and local purchasing with maintained productive capability. Enterprises agree how income pays contributors, covers operations and funds another cycle. Shared equipment, repair services and local supply relationships create further activity around existing resources. The people involved choose the arrangements for their particular work.

Measure the circulation itself: items repaired, containers returned, material received for another use, losses, processing costs and completed repeat cycles. Keep material movement separate from income movement so neither obscures the other. Those records reveal where redesign, a different supplier or a better collection arrangement improves the next cycle.

14 Commercial arrangements and mutual options

Commercial arrangements connect the contribution with its payment, costs and terms of use. A maker quotes for samples or a production run. A designer agrees a commission or licence. A retailer purchases stock. Participants agree any shared costs and income for a collection. Each arrangement belongs to the people and activity involved.

Mutuals are an optional arrangement alongside independent businesses, cooperatives, individual makers and joint projects. A mutual centres ownership on the benefit of its members. Participants choose the arrangement for their activity, with no required enterprise model across the engine. The record explains asset ownership, permitted use and the commitments attached to each exchange.

Mutual Futures connects this option with shared productive assets, livelihoods, paid learning and business succession. In the product engine, a member-owned production service, shared purchasing group or equipment enterprise gives that option a practical form. Members agree membership, decisions, contributions, costs, use of surplus, reserves and exit terms. Those terms belong to the mutual and create no authority over other engine participants. Each group selects its structure through its own formation process.

Costing follows the whole offer. Record materials, labour, packaging, freight, selling fees, returns and royalties. Include design, sampling, software, customer service and administration. Repair, collection and recovery services carry their own costs. This makes the price understandable in relation to the work and resources needed to deliver it.

For each sales route, compare net sales revenue with the variable cost of producing and fulfilling the order. The remaining contribution supports ongoing operating costs and the next cycle of activity. Direct sales, wholesale and bundled offers need separate calculations because quantities, prices and fulfilment effort differ. Record assumptions consistently and replace them with actual figures as activity occurs.

Cash timing connects purchases with production and sales. A deposit commits money before stock arrives. Materials, equipment and finished stock tie up resources while orders develop. Place those commitments alongside available funds, expected receipts and delivery dates. Participants committing resources see the particular obligations they accept.

Agreements explain payment, use of designs, handling of revisions, responsibility for fulfilment and how participation ends. Shared investment or ownership follows an explicit agreement. The engine keeps these terms accessible to the relevant participants and connected to the work they cover.

Productive participation grows through experience and relationships. Learning supports a new skill, paid work puts it to use, and successful exchanges create further opportunities. People choose their path through those activities. The engine makes contributions visible and easier to connect without turning them into a permanent hierarchy.

15 Connected records and useful software

The software connects records through explicit relationships. A person, product, material, recipe, pattern, artwork, project, offer, order and return each has a stable reference. Any record connects to several others. Views follow the task at hand: developing a sample, preparing a release, fulfilling an order or arranging the next use of material.

There is no required parent project or fixed chain of authority. A product connects to several Aura expressions, makers and sales offers. A community connects to several products and projects. People agree access for particular records and actions according to the work they share. Access to a file or permission to fulfil an order carries no broader standing in the network.

Human-in-the-loop AI agent processes carry work between these records. Capture information once and reuse it where relevant. A product specification supplies the maker's brief, product description and retailer sheet. A revised fabric changes the relevant garment records. A packaging change identifies affected costs and orders. Version history shows what changed and preserves the details needed to understand earlier production and sales.

The interface accepts conversation, forms, imported files and direct editing. An agent helps prepare briefs, organise comparisons and assemble release material. People specify the actions it is allowed to take. The same work remains accessible through ordinary records and exports, including when a participant changes software or service provider.

Connect existing payment, commerce, accounting and distribution services through the specific information each requires. The supplied indie distribution toolkit provides a reference for portable handoff documents. Music and creative tools provide asset workflows. Food tools contribute relevant preparation information. Resolve Automations connects media packages with editing and export tasks. Each connection has a clear purpose and a way to check that information reached its destination.

Circular records include return condition, material quantities, receiving services and the result of the next use. Community records connect invitations, activities and contributions with participants' chosen sharing preferences. Financial and personal information stays available to the people entitled to use it through the relevant arrangement.

Run the work on the devices and services suited to the task. Keep backups, usable exports and recovery instructions. Participants retain access to the information needed to continue their work when a hosting arrangement, tool or collaboration changes.

16 Human in the loop AI agent processes

Human in the loop, or HITL, connects people's judgement with AI agents carrying out the repetitive work around a product. A participant gives a brief once. Agents prepare connected outputs, check consistency and carry authorised work between design, marketing, sales and continued use. People shape the product and decide the commitments they make.

Each task brief names the intended result, source records, permitted actions, spending or publication limits and the person handling exceptions. Participants choose these arrangements for their work. Agent roles describe tasks, with no preset hierarchy or authority. Existing permissions carry forward within their agreed scope, so routine work proceeds without repeated approval requests.

Activity	Agent process	Human involvement
Product creation	Turn ideas into briefs, organise samples and prepare specifications	Choose the experience and respond to physical samples
Sourcing and costing	Compare quotations, calculate costs and assemble production packs	Select suppliers and authorise commercial commitments
Marketing	Prepare copy, images, release packs and channel variants	Set creative direction and agree publication scope
Sales and service	Prepare listings, process authorised orders and organise fulfilment	Set offers and resolve exceptions outside agreed terms
Community activity	Prepare invitations, collate feedback and connect contributions	Choose activities, participation and use of personal stories
Circular use	Match returns with receiving routes and track material movement	Confirm practical suitability and agree the next use

Agents pass a compact handoff containing the record reference, version, completed work, next task and unresolved questions. They reuse agreed information instead of asking each person to enter it again. A changed recipe, garment or delivery date identifies the related outputs needing revision. Independent tasks run together, while dependent tasks use the agreed version.

Human review arrives as a concrete result: a sample, comparison, proof or ready-to-use release pack. People edit it, accept it or redirect the task. Agents then execute within the recorded permission and verify the outcome. A failed step preserves completed work, checks for duplicate orders or messages and brings the specific exception to the relevant participant.

The record keeps the input, changes, human decision and result together. Participants pause or revoke agent permissions and continue through ordinary records and exports. Review time saved, repeated data entry, corrections and delivery reliability to improve the process. The aim is less administration and more time for making, relationships and useful decisions.

17 Screen and media production

The Minjerribah Screen & Media Network provides a project connection between local stories, creative skills, community screens and commercial production. The product engine applies that connection to make profiles, product demonstrations, club activity, music and release material. Each piece begins with a clear purpose and the people involved agreeing its use. A connection to the network does not presume an operating venue or an agreed broadcast slot.

The network's story workflow moves through contribution, verification, editing, publication, broadcast and archive. A maker supplies a demonstration, a club records an activity or a customer agrees to share an experience. The record keeps the source, context, permitted use and chosen destinations attached to the material. Participants agree each publication arrangement without introducing a central authority over the engine.

DaVinci Resolve Automations supplies the production method: collect, organise, assemble, shape and check. Gather footage, sound, music, artwork and the brief into one media package. Agents organise files, prepare selections and an edit map, then assist with assembly, captions and export preparation. People choose the story, performance, pacing and final use of the work.

A project asset bundle supplies logos, typography, colours, titles, sound and output layouts. Select the bundle for Aura, P4A, GAJRA Earth or the participating club. Review a representative style frame before applying it across a batch. Shared editing processes reuse the method while each bundle retains its identity. A change to one collection stays within the records and outputs using that version.

The Resolve project describes Astra MCP as a planned control bridge. Confirm supported controls on the editing computer using a disposable project, then delegate those actions within the agreed task. Keep changes reversible and preserve the editable Resolve project. Review captions against the recording and watch each export from beginning to end before release.

Delivery connects the finished piece to its agreed destination: a product page, social clip, club screening, retailer display or community screen. Prepare the appropriate widescreen, vertical or square version. The release pack carries filenames, credits, descriptions and use permissions. The people running each destination agree what appears there.

Sandy Sports and Screen Club connects this process with event stories and merchandise releases. Other participants reuse it for drinks, hygiene products and creative collections. Feedback returns to the product and media records. Archived footage and agreed reusable assets support later releases, while paid production and learning create further participation around the work.

18 Moving through a complete cycle

Take an Aura of Joy gathering as a worked example. People interested in the experience bring an elixir recipe, original music and reusable serving items into a shared brief. They describe the occasion and the products involved, then agree the contributions they want to make. The example traces one route through the engine. Other activity enters at any relevant point.

An AI agent turns the shared brief into connected tasks and a sample record. The drink maker prepares samples and records ingredients, process and serving cost. Participants taste them in the intended setting and describe their experience. A designer develops the label from the selected recipe and creative direction. The maker, designer and people arranging the gathering agree their work and payment. Agents carry those decisions into production and release records, checking that the agreed recipe, quantities and artwork stay consistent.

Agents prepare the invitation, images and release pack for human review. The Resolve workflow prepares a short demonstration using the collection's asset bundle. People review the edit, then agents carry out the agreed publication and ordering tasks. The offer explains the event price and any products available to buy. Release material links the music and the drink through the agreed creative terms. Orders connect to stock, quantities and the practical arrangements for serving and delivery.

At the gathering, people enjoy the products and contribute feedback if they choose. Some buy a bottle, others join a later activity, and some suggest a different flavour or serving format. Agents collate each response in the relevant record and bring questions needing judgement to the people involved. No purchase or contribution establishes rank within the group.

Afterwards, returned containers reach the agreed receiving process. Remaining stock, unused ingredients and material losses enter the production record. Sales receipts and costs show the economics of the activity. Participants settle their agreed payments and decide which further exchanges they want to undertake.

The next cycle draws on what happened. A recipe changes, a retailer places an order, a return point improves or another group hosts its own gathering. The design files, supplier contacts and experience remain connected and usable through their agreed terms. Community relationships continue through the activity people choose together.

Aura Undies follows the same connected method through garment samples, chosen virtues, fitting feedback, release material, orders and textile use. Merchandise and music introduce further routes. The engine's value lies in helping people move through those real exchanges, earn livelihoods and keep products, resources and knowledge useful across repeated cycles.
